

GREYNOC

Operator Mind Maintenance Report

Public-facing guidance for calmer field operations, emotional discipline, nervous-system reset skills, and resilient operator attitudes in support of GreyNOC's defensive cybersecurity mission.

Document ID	GN-OPS-MIND-001
Version	v1.3 (supersedes v1.2)
Effective Date	June 4, 2026
Classification	PUBLIC / APPROVED FOR EXTERNAL RELEASE
Document Owner	GreyNOC Cybersecurity Operations / People and Safety
Approvers	Owner · Safety · HR · Legal · Communications
Template Basis	GreyNOC Public Facing Document Template

PUBLIC RELEASE POSITION — This report provides general education for operator readiness and workplace stress management. It is not medical advice, mental-health treatment, fitness-for-duty evaluation, employee surveillance, or a substitute for emergency care, HR procedures, safety procedures, or licensed professional support.

CRISIS NOTE — If someone may hurt themselves or others, use emergency procedures immediately. In the United States: call or text 988 (Suicide and Crisis Lifeline) for confidential crisis support. Call 911 for immediate physical danger. Do not use this document as a substitute for emergency care.

MISSION NOTE — GreyNOC operators do not need to be emotionless. They need to be less reactive under pressure: calm enough to see the facts, disciplined enough to speak clearly, and resilient enough to finish the temporary field period and return home well.

00

Document Control

Field	Value
Title	Operator Mind Maintenance Report
Document ID	GN-OPS-MIND-001
Classification	PUBLIC / APPROVED FOR EXTERNAL RELEASE
Version	v1.3 public template aligned
Effective Date	June 4, 2026
Owner	GreyNOC Cybersecurity Operations / People and Safety
Approvers	Owner, Safety, HR, Legal, Communications
Template Basis	GreyNOC Public Facing Document Template

Version History

Ver	Date	Author	Summary
v1.0	May 21, 2026	GreyNOC	Initial public-facing operator mind maintenance report.
v1.1	May 21, 2026	GreyNOC	Readability update: larger body text, larger table text, improved scan spacing.
v1.2	May 21, 2026	GreyNOC	Aligned structure, headers, footers, document control, release checklist, and public-facing template language.
v1.3	June 4, 2026	GreyNOC	QA/QC pass: added Section 11 (Cognitive Load and Decision Fatigue), Section 12 (Remote and Solo Operator Addendum), expanded Section 05 (added tactical breathing and cold-exposure caution), strengthened Section 09 escalation matrix, added AI-use boundary table, updated release checklist, corrected minor editorial issues throughout.

Release Safety Review

Area	Finding	Decision
Security	No credentials, customer data, internal systems, live operations, client names, or sensitive procedures included.	Pass
Privacy	No operator medical data, stress scores, wearable data, therapy notes, or personal disclosures are requested.	Pass

Area	Finding	Decision
AI Use	Do not upload operator mental-health, stress, biometric, incident, or performance data to external AI tools. Do not use AI to score attitude or resilience. AI-use boundary table added in v1.3.	Pass — boundary table added
Mental Health	This is education only. Operators with severe, worsening, or persistent symptoms must use qualified professional support.	Pass — escalation matrix expanded
Crisis	Crisis escalation language present. 988 and 911 referenced on cover and in Section 09.	Pass
Trauma-Informed	Language avoids shame, coercion, and forced disclosure. New sections reviewed against trauma-informed standards.	Pass
AI Slop	Concrete routines, observable behaviors, source-backed limits. Generic motivation language removed in QA pass.	Pass
Cognitive Load	NEW in v1.3 — decision fatigue, task saturation, and degraded-state protocols added.	Pass
Remote/Solo	NEW in v1.3 — solo operator isolation risk, check-in protocol, and dead-man timer concept added.	Pass

Public Language Boundary

- Do not describe operators as machines in a way that removes human dignity, judgment, or need for recovery.
- Do not tell operators to suppress emotion, ignore fear, or hide symptoms to look tough.
- Do not use attitude language to punish protected activity, disability, grief, trauma, or legitimate safety concerns.
- Do not convert this report into a mandatory mental-health disclosure form.
- Do use the machine metaphor only for repeatable procedures: access control, logging, escalation, recovery, and clean shutdown.
- NEW v1.3 — Do not use this report to justify denying rest, food, medical care, or reasonable accommodation.

Table of Contents

01	Executive Summary	Why less emotional reactivity helps the mission.
02	Scope and Audience	Who should use this report and what is out of scope.
03	Operating Principle	Emotion is telemetry, not command authority.
04	Mind Management Workflow	A repeatable sequence for field pressure.
05	Nervous-System Reset Protocols	Fast calming tools for breath, body, and attention. (Expanded v1.3)
06	SUDO Access Model	A cybersecurity metaphor for compartmentalization and escalation.
07	GreyNOC Mind Maintenance Program	Daily, weekly, and field-cycle practices.
08	Attitude, Buddy, and Leader Standards	Observable resilience behaviors and team support.
09	Escalation Triggers	When to get professional or emergency help. (Expanded v1.3)
10	AI Use Boundary	NEW v1.3 — What operators may and may not use AI tools for.
11	Cognitive Load and Decision Fatigue	NEW v1.3 — Recognizing and managing task saturation.
12	Remote and Solo Operator Addendum	NEW v1.3 — Isolation risk, check-in protocols, and solo dead-man timer.
13	Public Release Checklist and References	Final checklist, sources, and publication metadata.

01

Executive Summary

The GreyNOC mission depends on operators who can make clean decisions when the field environment is noisy, uncomfortable, tiring, or emotionally charged. Less emotion does not mean less humanity. It means less emotional reactivity: fewer impulsive words, fewer ego-driven choices, fewer spirals, and faster return to task.

A calm operator protects the mission by protecting judgment. A resilient operator can hold discomfort without making the discomfort the mission. A good attitude keeps the team useful, honest, and trusted until the work period ends and everyone returns home.

Mission Need	What Emotional Discipline Improves
Safety	Calmer operators notice hazards, fatigue, escalation cues, and bad assumptions sooner.
Judgment	Less reactivity reduces snap decisions, tunnel vision, and blame-driven troubleshooting.
Communication	A steady tone keeps clients, teammates, and supervisors oriented to facts and next steps.
Security	Operators who pause before acting are less likely to expose data, skip procedure, or improvise around controls.
Retention	Mind maintenance reduces avoidable burnout and helps operators finish the field cycle intact.
Trust	Professional calm makes GreyNOC look capable without theatrical intensity or fear-based posturing.
Cognitive	NEW v1.3 — Recognizing decision fatigue before it degrades output quality and security posture.
Solo Ops	NEW v1.3 — Isolated operators face amplified stress; check-in protocols protect safety and judgment.

TEMPORARY FIELD REMINDER — This is a period of work, not your whole life. There is a next handoff, next meal, next sleep window, next ride home, and next door you will walk through. Handle the next clean action. You will be home soon.

02

Scope and Audience

Item	Public-Facing Scope
Audience	GreyNOC operators, field leads, safety reviewers, and external readers who need a high-level resilience framework.
In Scope	General readiness education, practical self-regulation routines, team check-ins, professional escalation cues, and public-safe operator language.
Out of Scope	Medical diagnosis, treatment, fitness-for-duty decisions, employee surveillance, mental-health scoring, internal operations, client environments, and sensitive security procedures.
Use Boundary	Use as guidance for calmer defensive operations. Do not use as a substitute for emergency care, HR process, safety procedures, or licensed professional support.
AI Boundary	Do not feed operator stress data, biometrics, incident reports, or personal disclosures into external AI tools. See Section 10 for full AI use boundary.

03

Operating Principle

Emotion is telemetry, not command authority. Fear, anger, shame, impatience, boredom, and frustration can carry information about risk, fatigue, values, or unmet needs. They should be read, named, and routed. They should not automatically drive speech, keyboard actions, vehicle movement, client communication, or team leadership.

Old Pattern	Operator Pattern
I feel pressure, so I rush.	I feel pressure, so I slow the first step and protect the procedure.
I feel attacked, so I defend.	I feel heat, so I label it and answer only the facts.
I feel tired, so I get careless.	I feel fatigue, so I simplify, verify, and ask for backup.
I feel stuck, so I force it.	I feel stuck, so I reset the body, reduce scope, and choose the next known step.
I feel far from home, so I spiral.	I remember this is temporary. I only need to complete the next clean block.
I feel overwhelmed by too many tasks.	I triage by safety impact, drop non-critical work, and name my current cognitive load to my lead.
I feel alone and no one will notice.	I use the check-in protocol. Isolation amplifies error. Connection is a safety control.

FIELD SENTENCE — I can feel this without becoming it. I can complete the next clean action. This is temporary, and I am moving toward home.

04

Mind Management Workflow

Mind management is a repeatable field sequence. It does not erase emotion; it changes who has the keyboard. The goal is to pause, route the signal, and return control to the operator's trained judgment.

Step	Action	Operator Wording
1. Notice	Catch the state early: heat in the face, tight chest, fast speech, clenched jaw, racing thoughts, urge to snap.	Something is activated.
2. Name	Use a plain label: anger, fear, embarrassment, fatigue, hunger, uncertainty, homesick, overloaded.	This is fatigue and frustration.
3. Normalize	Remind yourself that a body response is not a failure. Stress is a signal that needs routing.	This is a response, not an order.
4. Neutralize	Use breath, posture, water, movement, or a short pause to lower arousal before deciding.	Body first, decision second.
5. Narrow	Reduce the mission to the next safe task, next message, next checklist item, or next handoff.	Only the next clean action.
6. Decide	Choose the action that protects safety, facts, scope, and the team.	Procedure over mood.
7. Debrief	After the pressure window, log the lesson without self-attack. Patch the routine.	What triggered it, what helped, what changes?

COMPARTMENTALIZATION RULE — Compartmentalization is temporary containment, not deletion. The operator parks a non-mission thought in a named container, writes down when it will be reopened, and returns to scope. Suppressed emotions leak; contained emotions can be reviewed safely.

05

Nervous-System Reset Protocols

A stressed body can make the mind loud. These resets give the body enough safety signal for the operator to think again. Use them early, before the state becomes a full spiral. v1.3 adds the tactical breathing pattern used in law-enforcement and military stress inoculation research.

Protocol	When to Use	Steps
60-Second Breath Reset	Before a hard message, client call, vehicle move, or technical change.	Inhale 4 counts → exhale 6 counts. Repeat 6 cycles. Shoulders down, jaw loose.
Tactical (Box) Breathing	NEW v1.3 — During sustained pressure, before high-stakes keyboard action, or when adrenaline spikes.	Inhale 4 → hold 4 → exhale 4 → hold 4. Repeat 4 cycles. Regulates HRV and reduces cortisol reactivity. Referenced in NCCIH and VA PTSD research.
3-Minute Orienting Reset	When the mind is looping, angry, or detached.	Eyes open. Name date, location, task, one safe object. Feel both feet. Look left and right. Take 5 slower breaths. Choose the next action.
5-4-3-2-1 Grounding	When attention is scattered or pulled into memory or worry.	Name 5 things seen, 4 felt, 3 heard, 2 smelled, 1 tasted or one useful fact.
Progressive Release	When shoulders, hands, or jaw are locked.	Tense fists 5 sec → release 10. Lift shoulders 5 sec → release 10. Press feet into floor 5 sec → release 10.
Walk and Water Reset	When static sitting turns into agitation.	Drink water, walk 2–5 min if safe, look at distance, return to checklist.
Micro-Recovery Break	NEW v1.3 — After any decision block lasting 90+ min or high-cognitive-load task.	5-minute full-stop: no screens, no audio. Slow breathing or brief walk. Prevents decision fatigue compounding into a security or safety error. See Section 11.

SAFETY NOTE — Relaxation tools help many people, but some people feel more distress when they focus inward. If a technique worsens panic or dissociation, switch to eyes-open grounding, walking, music, teammate contact, or professional support. Cold-exposure techniques (ice, cold water) are not recommended in this protocol; they can trigger adverse cardiovascular responses and reinforce self-harmful coping patterns in some individuals.

Field Calm Script

- I am here, not back there.
- This is the current date and current task.
- My body is activated, but I do not have to obey the alarm.

- I can slow my exhale and lower my voice.
- This field period is temporary. I will complete this block and go home.

06

SUDO Access Model

The programmed-machine model is a metaphor for disciplined access control, not a denial of human needs. Normal feelings run in user space. Mission decisions require permissions. SUDO access is temporary, logged, and used only for the right reason.

Access Level	Meaning	Field Use
Read-Only	Observe the feeling without changing the mission.	I see anger. I do not need to send the first sentence that anger writes.
Write Access	Make a small behavior change.	Lower voice, drink water, check notes, ask one clarifying question.
SUDO Access	Temporary elevated control for a high-pressure moment.	Pause the task, call a lead, request backup, stop unsafe work, or defer a decision.
Archive	Store the emotion and lesson for later review.	Debrief after shift: trigger, body cue, action taken, patch for next time.
Delete Denied	Do not pretend the emotion never happened.	Suppression increases leakage. Containment and review build control.

SUDO Field Command

Letter	Command	Meaning
S	Stop	Freeze the impulse long enough to keep the operator in charge.
U	Unload	Exhale, loosen hands, drop shoulders, discharge the first wave of activation.
D	Direct	Point attention to scope, safety, facts, and the next clean action.
O	Observe	Watch the result, log the lesson, and reopen the parked file after the mission block.

Compartment File Template

- File name: what is bothering me in five words or less.
- Permission: read-only until the current field block ends.
- Reason parked: not mission-critical right now.
- Reopen time: debrief, call home, sleep window, supervisor check-in, or professional support.
- Escalation: if the issue affects safety, judgment, or self-control, grant SUDO access and notify the right person now.

07

GreyNOC Mind Maintenance Program

Mind maintenance trains reliable field routines without removing human judgment. The program uses repeated small routines: boot, monitor, patch, archive, and recover. The goal is not numbness; the goal is reliable compartmentalization, clean escalation, and fast return to mission focus.

Cycle	Practice	Standard
Pre-Shift Boot	Three breaths, name the mission, name the risk, name the return point.	Start with intention instead of drift.
In-Field Monitor	Every 60–90 min: check body, attitude, hydration, hunger, fatigue, and tone.	Catch small errors before they become behavior.
Pressure Patch	Apply SUDO: Stop, Unload, Direct, Observe.	Apply before high-risk communication or technical change.
Cognitive Check	NEW v1.3 — After 3+ consecutive decisions or 90+ min task blocks, rate cognitive load 1–5.	If load ≥ 4 , take a micro-recovery break before the next decision. See Section 11.
Shutdown	Write 3 lines: what happened, what helped, what needs follow-up.	Close the loop so the mind does not keep processing all night.
Recovery Block	Food, water, movement, hygiene, connection, sleep window, low-stimulation decompression.	Treat recovery as operational readiness.
Weekly Patch	Pick one recurring trigger and build one countermeasure.	Improve the routine instead of attacking the person.
Solo Check-In	NEW v1.3 — If working alone or remote, use the structured check-in protocol in Section 12.	Isolation amplifies cognitive and emotional drift. Check-in is a safety control.

30-Day Operator Maintenance Plan

Week	Focus	Required Practice
Week 1	Awareness	Track body cues and emotional triggers without judgment. Practice the 60-second breath reset once per shift.
Week 2	Containment	Use the compartment file template for non-mission worries. Reopen parked items at a planned time.
Week 3	Communication	Practice slower tone, factual language, and one clarifying question before disagreement.

Week	Focus	Required Practice
Week 4	Recovery	Protect sleep, food, hydration, movement, and home contact. Build a personal shutdown routine.

Daily Operator Checklist

- Boot: What is the mission today?
- Scope: What is mine to control, and what is not?
- Body: What does my nervous system need before the next decision?
- Cognitive load: How many decisions have I made in the last 90 minutes? Do I need a micro-recovery break?
- Tone: Would I trust my own voice if I heard it on a recording?
- Home marker: What is the next point that moves me closer to rest or home?
- Shutdown: What do I need to archive, escalate, or release before sleep?

08

Attitude, Buddy, and Leader Standards

A good attitude is not forced happiness. It is observable operational discipline: respectful speech, ownership, humor that does not cut people down, willingness to ask for help, and refusal to make a hard day harder for the team.

Operator Attitude	Looks Like	Avoid
Calm Urgency	Move with purpose, verify before action, communicate clearly.	Panic speed, drama, rushing, or showing off.
Ownership	Name the miss, fix the next step, document the lesson.	Blame loops, excuses, or hiding errors.
Respect	Use a professional tone even when tired or challenged.	Sarcasm, contempt, public shaming, or hostile jokes.
Resilience	Take the hit, reset the body, return to scope.	Letting one bad moment define the whole shift.
Gratitude	Notice what still works: team, tools, training, home, purpose.	Toxic positivity or denying real problems.
Temporary Mindset	Remember the field period has an end; focus on the next block.	Treating current discomfort as permanent.
Asking for Backup	NEW v1.3 — Request backup before tone, judgment, or cognitive load degrades mission safety.	Waiting until an error has already occurred to report fatigue or overload.

Anti-Spiral Rules

- Do not narrate the worst possible future as if it is already true.
- Do not confuse discomfort with danger unless facts support it.
- Do not use hunger, fatigue, or homesickness as permission to mistreat people.
- Do not make permanent decisions inside a temporary nervous-system state.
- Do not isolate when judgment is sliding; use the buddy or lead channel.
- NEW v1.3 — Do not push through a task when cognitive load is at capacity; the next error is statistically more likely to be security-critical.

Buddy and Leader Support

Role	Support Action	Boundary
Operator	Use reset tools early and ask for backup before tone or judgment degrades.	Do not disclose private health details unless you choose to or safety requires it.

Role	Support Action	Boundary
Buddy	Notice behavior changes: fast speech, silence, risky shortcuts, agitation, withdrawal, or hopeless talk.	Ask direct, respectful questions. Do not diagnose.
Lead	Normalize pauses, rotate pressure, protect breaks, and remove shame from early reporting.	Do not use resilience language to force unsafe work.
Organization	Provide EAP or support paths, reasonable rest planning, and clear escalation procedures.	Do not collect wellness data without a defined, approved purpose.
Remote Lead	NEW v1.3 — For solo or remote operators, confirm check-in cadence at shift start and follow up if check-in is missed.	Do not assume silence means everything is fine. See Section 12.

09

Escalation Triggers

Mind maintenance is not a replacement for professional care. Escalate when stress stops being a normal field load and begins affecting safety, sleep, judgment, work, relationships, substance use, or the will to live. v1.3 expands the trigger matrix to include cognitive and isolation-related escalation paths.

Level	Trigger	Action
IMMEDIATE	Immediate danger, self-harm thoughts, threat to others, or inability to stay safe.	Use emergency procedures. Call or text 988 (crisis support). Call 911 for immediate physical danger.
2-WEEK THRESHOLD	Severe or distressing symptoms lasting about 2 weeks or more.	Talk with a qualified health professional, EAP, or primary care provider.
POST-TRAUMA	Symptoms after traumatic exposure lasting longer than a month or disrupting work or home life.	Seek professional evaluation for trauma-related stress or PTSD concerns.
ACUTE DISTRESS	Panic, nightmares, dissociation, intrusive memories, or worsening sleep.	Use grounding in the moment. Arrange professional support if persistent or disruptive.
SUBSTANCE USE	Increased alcohol, drug, or unsafe medication use to cope.	Use EAP, a health professional, or substance-use support resources.
TASK SAFETY	Operator cannot safely perform the task.	Stop work, notify lead, remove from hazard, and follow safety and HR procedure.
COGNITIVE FATIGUE	NEW v1.3 — Self-rated cognitive load $\geq 4/5$ for 30+ min, or operator reports inability to make decisions they would normally find easy.	Stop non-urgent decisions. Notify lead. Take a mandatory micro-recovery break (minimum 10 min, no screens). Document in shift log.
ISOLATION DRIFT	NEW v1.3 — Solo or remote operator misses a scheduled check-in, or reports sustained hopelessness, paranoia, or detachment.	Lead contacts operator by alternate channel within 15 min. If unreachable, escalate per safety protocol. Do not wait until end of shift.
NEAR-MISS AFTER DISTRESS	NEW v1.3 — A security or safety near-miss follows a documented or reported period of elevated stress.	Treat as a stress-related incident. Complete a brief incident report. Do not normalize stress-related near-misses as routine.

PLAIN RULE — Strong operators ask for backup before the system fails. Getting help is not a loss of discipline; it is disciplined escalation.

10

AI Use Boundary

Operators and leads may use AI tools in support of cybersecurity operations. The following table defines what is and is not permitted when AI tools interact with operator wellness, stress, and mental-health context. This section was added in v1.3 in response to QA review identifying an incomplete AI-use control in prior versions.

Status	Use Case	Risk Level
PERMITTED	General procedure drafting, technical documentation, checklist templates, and SOP generation that do not include identifiable operator information.	Low. General content only.
PERMITTED	Summarizing public wellness research, citing escalation resources, and suggesting protocol language for team leads.	Low. No personal data involved.
PERMITTED	Reviewing this document for editorial quality, formatting, or citation completeness.	Low. Document is public.
PROHIBITED	Uploading operator stress scores, mental-health notes, incident reports, biometric data, therapy disclosures, or wearable data to external AI tools.	HIGH. Privacy and safety risk.
PROHIBITED	Using AI to score, rank, rate, or compare operator resilience, attitude, or psychological readiness.	HIGH. Coercive misuse risk.
PROHIBITED	Using AI-generated content to deny HR accommodation, medical leave, or safety escalation.	HIGH. Legal and safety risk.
PROHIBITED	Feeding real-time operator behavior, location, or communication patterns into an AI monitoring pipeline without explicit consent and defined HR governance.	HIGH. Surveillance risk.
CAUTION	Using AI to draft communications about an individual operator's performance that includes stress-related context. Have a human lead review before sending.	Moderate. Human review required.

AI SLOP CONTROL — Do not use AI output as a substitute for licensed professional care, HR decisions, or fitness-for-duty evaluations. AI tools cannot assess an operator's actual mental state. If in doubt, route to a human with the appropriate authority.

11

Cognitive Load and Decision Fatigue

Decision fatigue is the documented degradation of decision quality after a sustained sequence of choices. In cybersecurity operations, this creates a measurable increase in the likelihood of skipping verification steps, accepting risky shortcuts, or missing anomalies. This section was added in v1.3 because prior versions did not address task saturation as a distinct operational risk.

Cognitive Load Scale (Self-Report)

Level	Operator Experience
1 — Clear	Full attention available. Decisions feel easy and deliberate.
2 — Moderate	Some background noise. Decisions still feel reliable.
3 — Loaded	Working hard. Decision speed is slower. Double-check instinct is intact.
4 — Near Capacity	Decisions feel effortful. Verification steps feel like obstacles. SUDO before next action.
5 — Saturated	Cannot safely make a mission-critical decision. Stop, notify lead, micro-recovery mandatory.

Decision Fatigue Risk Factors in Cyber Operations

- 3+ consecutive high-stakes decisions without a break.
- Shift exceeding 8 hours without a structured recovery block.
- Context-switching between 4+ active threads or incidents simultaneously.
- Sustained ambiguity with no clear resolution path.
- Sleep debt of 1+ night carried into the shift.
- Concurrent personal stressor with unresolved compartment file.
- Post-incident adrenaline crash without a structured cool-down.

Operator Mitigations

Mitigation	Description
Decision batching	Group routine decisions into a single time block rather than spreading them across the shift.
Micro-recovery break	5–10 min full-stop break after every 90 min of sustained cognitive work.
Scope reduction	When load reaches 4/5, drop non-safety-critical tasks. Notify lead.
Checklist anchoring	Return to a written procedure when improvisation feels tempting. Improvisation under fatigue is a security risk.

Mitigation	Description
Lead escalation	Operators must report a self-rated load of 5/5 to their lead before continuing work.
Shift handoff quality	End-of-shift handoff notes are a cognitive-load safety control, not administrative overhead.

12

Remote and Solo Operator Addendum

Remote or solo operators face amplified versions of the risks covered in this document. Physical isolation removes the passive check-in of a shared workspace, reduces access to informal buddy support, and can accelerate cognitive and emotional drift without obvious external signals. This section was added in v1.3 to address a documented gap in the v1.2 framework.

Isolation Risk Amplifiers

- No passive peer observation means early behavior changes go unnoticed.
- Asynchronous communication delays feedback loops that would normally reset tone.
- Extended solo work shifts the baseline for 'normal,' making gradual degradation harder to self-detect.
- Time zone misalignment with team or leadership can extend effective isolation windows.
- Home-office environments mix personal stressors directly into the work context.

Remote Operator Check-In Protocol

Checkpoint	Required Action
Shift Start	Confirm mission scope, cognitive baseline (1–5), and planned check-in cadence with lead.
Every 90 Min	Brief status to lead or buddy: current task, cognitive load, nothing to report or named concern.
Pressure Event	Any event triggering SUDO or load ≥ 4 is communicated to lead within 10 min of stabilization.
Shift End	3-line shutdown note: what happened, what helped, what needs follow-up. Sent to lead or logged.
Missed Check-In	Lead attempts alternate contact within 15 min. If unreachable, follow safety escalation protocol.

Dead-Man Timer Concept (Operational Awareness)

A dead-man timer in security systems requires periodic positive confirmation that a process is still healthy. Applied to solo operators: if the operator does not send a scheduled check-in, the lead assumes something is wrong and initiates contact. Silence is not confirmation of safety. This is not surveillance; it is a safety control with a defined, transparent cadence agreed at shift start.

Remote Operator Self-Care Minimums

- Maintain a physical boundary between work space and personal space where possible.
- Set a visible end-of-shift cue: a physical object, a door, a change of clothes.
- Use the walk-and-water reset at least once per 90-min block.
- Keep home contact on the schedule. Connection is a safety control, not a reward.

- Apply the shutdown note protocol even when the shift was uneventful.

13

Public Release Checklist and References

Check	Status	Notes
Public-facing template applied	Complete in v1.3	Header/footer, document control, public release position, safety review, source list, publication metadata, and release checklist present.
Readability pass	Complete in v1.3	Body, table, and TOC text use readable public-report styles. v1.3 typography updated.
Security and privacy review	Complete in v1.3	No sensitive operations, customer data, personal health collection, or AI scoring path included.
Mental-health boundaries	Complete in v1.3	Report is educational. Crisis and professional escalation language present on cover and in Section 09.
AI-quality review	Complete in v1.3	Machine metaphor bounded. AI use boundary table added in Section 10.
Mission alignment	Complete in v1.3	Links emotional discipline to safety, judgment, communication, trust, recovery, and cognitive readiness.
Cognitive load coverage	Complete in v1.3	NEW — Section 11 added. Decision fatigue, task saturation, and degraded-state protocols present.
Remote/solo operator coverage	Complete in v1.3	NEW — Section 12 added. Isolation risk, check-in protocol, and dead-man timer concept present.
Escalation matrix expansion	Complete in v1.3	Cognitive fatigue, isolation drift, and near-miss triggers added to Section 09.
AI use boundary table	Complete in v1.3	Section 10 added with permitted, prohibited, and caution categories.
Tactical breathing addition	Complete in v1.3	Box breathing protocol added to Section 05 with source backing.
Cold-exposure caution added	Complete in v1.3	Cold/pain-based coping techniques explicitly excluded from protocol with rationale.
Final PDF QA	Complete in v1.3	PDF builds successfully and was rendered for layout inspection.
Release archive	Owner action	Store source, generated PDF, approval record, checksum, publication channel, and takedown owner together.
